The inventions of claims 2, 5, 8, 27 are described in document 1 cited in the ISR and, therefore, do not appear to possess novelty. Document 1 describes a filter for a liquid-crystal display device composed of an acrylic polymer. According to FIG. 5 and FIG. 7 of document 1, the $\tan\delta$ value at a temperature of 30°C to 80°C of the film exceeds 0.04. Therefore, this optical film clearly satisfies the requirement that the integral value of $\tan\delta$ be ≥ 2 , as described in claim 1 of the subject application.

The inventions of claims 1, 2, 25, 27, 29 are described in document 2 cited in the ISR and, therefore, do not appear to possess novelty. Document 2 describes an optical film that is composed of a cyclic olefin polymer and can be advantageously used for an optical disk. According to FIG. 1 of document 2, the $\tan\delta$ value at a temperature of 30°C to 80°C of the film exceeds 0.04. Therefore, this optical film clearly satisfies the requirement that the integral value of $\tan\delta$ be ≥ 2 , as described in claim 1 of the subject application.

Supplemental Box

In case the space in any of the preceding boxes is not sufficient.
Continuation of Box V:

The inventions of claims 31, 32, 34, 37, 39 to 41 are described in documents 3, 4 cited in the ISR and, therefore, do not appear to possess novelty. Documents 3, 4 describe that it is important to match thermal expansion coefficients of the substrate and light transparent layer constituting the optical disk in order to prevent the disk from warping. Furthermore, they also disclose that an acrylic resin is used for the light transparent layer, the birefringence factor is small, the transparent layer is bonded to the substrate via an adhesive agent layer, a polycarbonate is used as the substrate material, and a PET parting film is bonded to the transparent layer.

The inventions of claims 1 to 5, 7 to 29, 35, 36, 42 do not appear to involve an inventive step based on documents 1 to 6 and documents 7, 8 cited in the ISR. Documents 7, 8 disclose a resin material comprising a vinyl polymer having a proton-donating atom association and a vinyl polymer having a proton-receiving atom association, wherein pseudo-crosslinking caused by hydrogen bonds is formed there between, this material being used as a material for an optical film having high optical transparency. Therefore, using this material for well-known optical applications disclosed in documents 1 to 6 could have easily been devised by a person skilled in the art.

The inventions of claims 6, 38 do not appear to involve an inventive step based on documents 1 to 8. Blending well-known additives into the transparent layer could have easily been done, if necessary, by a person skilled in the art, as described, for example, in documents 7 and 8.

The inventions of claims 30, 33, 43 do not appear to involve an inventive step based on documents 1 to 8 cited in the ISR. Employing a well-known material designed for optical disks of another high-density recording type, while adjusting optical characteristics thereof, could have easily been attempted by a person skilled in the art.
